

# What are the EnvO terms and how to include them?

## Short Answer

The EnvironmentOntology (EnvO) terms refer to key environment-types that may be used to facilitate the retrieval and integration of a broad range of biological data.

## Detailed Answer

We suggest to include three of the [EnvO](#) terms that could help your data to be reusable: environment (biome), environment (material), and environment (feature). More details about these three terms (and the format used to include them correctly) are to be found on the [field descriptions](#) of our template.

If you still have doubts about the EnvO parameters we could support you with that.
